UCCE offers latest in Ag science and management

As new technology and better practices emerge, local farmers need to remain informed about the latest developments in the agricultural industry.

A week ago, the University of California Cooperative Extension of Imperial County held the 28th annual Fall Desert Crops Workshop to cover a wide range of topics which interest local farmers and growers.

Among the 14 different presentations given included water management, nutrient management, sunflower crop water use, and comparison of drip and furrow irrigation for onions, invasive pest species in Imperial County, cover cropping in the low desert and Rhodes grass. Continue the good work.
